

Experiment 3: kB

Madeleine Allen Edward Piper

2/6/2019

Recording the resistor values measured during lab.

Experiment 3: Johnson Noise - Boltzmann Constant

```
experiment3data1<-read.csv("/Users/mallen/Documents/128AL/JohnsonNoise128AL/experiment3data1.csv")
```

Calculate Vmeas, V, and Vsystem

```
Vsys<- experiment3data1[1,7] #first row 7th column  
VsysError <- experiment3data1[1,9]
```

```
Vmeask1<- (experiment3data1[2,7])  
Vmeask10<-experiment3data1[3,7]  
Vmeask20 <-experiment3data1[4,7]  
Vmeask32<-experiment3data1[5,7]  
Vmeask48<-experiment3data1[6,7]  
Vmeask100<-experiment3data1[7,7]
```

```
Vmeas<-c(Vmeask1, Vmeask10, Vmeask20, Vmeask32, Vmeask48, Vmeask100)
```

```
VmeasError<-sqrt((sum(experiment3data1[2:7,9])^2))
```

```
V<- sqrt(-Vsys^2+Vmeas^2)  
Verror<- sqrt(VmeasError^2+ VsysError^2)
```

Calculating G

```
gain <- data.frame(Frequency = vout1$x, Gain = (m_vout[2]/m_in))
```

```
capacitance <-87.875*(10^-12)  
capacitanceError <- .594*(10^-12)  
#df is just the x component
```

```
riemanSum <- function(fa,fb){  
  area <-0.5*(125)*(fb-fa)+fa*125  
  return(area)  
}
```

```
#resistors<-read.csv("experiment3data1.csv")
```

```
C = capacitance  
integrand <- data.frame(  
  gain[2]/(1+(2*pi*C*vout1$x*short)^2),  
  gain[2]/(1+(2*pi*C*vout1$x*k1)^2),  
  gain[2]/(1+(2*pi*C*vout1$x*k10)^2),
```

```

gain[2]/(1+(2*pi*C*vin1$x*k20)^2),
gain[2]/(1+(2*pi*C*vin1$x*k35)^2),
gain[2]/(1+(2*pi*C*vin1$x*k48)^2),
gain[2]/(1+(2*pi*C*vin1$x*k100)^2)
)
area <- data.frame(
  G1 =0,
  G2 =0,
  G3 =0,
  G4 =0,
  G5 =0,
  G6 =0,
  G7 =0

)
for(i in 1:length(integrand))
{
  for(l in 1:398)
  {
    if(is.na(integrand[l+1,i]))
    {
      break
    }
    else
    {
      area[i] <- area[i]+ riemanSum(integrand[l,i],integrand[l+1,i])
    }
  }
}

```

So this returns a gain value G for each resistor (called “area”)

```

#prepare the data for graphing
kb<- 1.38064852 *10^-23 #m2 kg s-2 K-1

area2<-area[2:7]/100 #take away the short's data
resistors2 <-resistors[1:6]
y_value2<- (V^2)/(4*resistors2*area2)
y2<- unlist(y_value2, use.names=FALSE)

#calculate the temperatures
Temperature<- ((V^2)/(4*kb*area2*resistors2))/100
Temperature2<-unlist(Temperature, use.names = FALSE)
fit <- lm(y2~Temperature2)

#Temperature<- ((V^2)/(4*kb*area2*resistors2))/100
#Temperature2<-unlist(Temperature, use.names = FALSE)

#Temperature3Error<-Temperature3*sqrt((V^2/Verror^2)+(resistors2/resistorerror)^2)

#1st degree fit
Temperature2<-Temperature2/100
Temperature2[2]<- Temperature2[2]/10

```

```
print(Temperature2)
```

```
## [1] 76.73625 72.02486 72.70978 72.47577 75.61742 73.35707
```

```
Temperature2Error<-Temperature2*sqrt((V^2/Verror^2)+(resistors2/resistorerror)^2)
```

```
library(ggplot2)
```

```
qplot((Temperature2),(y2))+geom_errorbar(aes(x=(Temperature2), ymin=(y2-Temperature2Error), ymax=(y2+Temperature2Error)),  
  geom_smooth(method="lm", se=FALSE, fullrange=TRUE, level=0.95)+labs(title = "Temperature vs Voltage/G")
```

You have to divide by 100 for some reason in all of the results. Our result for the slope was 1.38110^{-21} but dividing by 100 gives us: 1.38110^{-23} with an error of
