# Experiment 2: Temperatures for Gain 250

Madeleine Allen, Edward Piper 2/7/2019

### Experiment 2: Johnson Noise 1

Recording the resistor values measured during lab.

```
#everything will be in ohms
short < -.03
shortError<-.001
k20<-20090
k20error<-1
k35 <- 35230 #secretly 35.2 but that would be an ugly variable name
k35error<-1
k100 <- 100700
k100error <- 1
k10 <- 999.05
k10error<- .01
k1 <- 998.17
k1error <- .01
k48 <- 48650 #secretly 48.7k but again that would be an ugly variable name
k48error<- 1
resistors<-c(k1,k10,k20,k35, k48,k100)
resistorserror<-c(k1error, k10error, k20error, k35error, k48error, k100error)
```

Import Band Voltage measurements from experiment 2

experiment2data<-read.csv("/Users/mallen/Documents/128AL/JohnsonNoise128AL/experiment2data2.csv")

Calculate Vmeas, V, and Vsystem

```
Vsys<- experiment2data[1,7] #first row 7th column
VsysError <- experiment2data[1,9]

Vmeask1<- (experiment2data[2,7])
Vmeask10<-experiment2data[3,7]
Vmeask20 <-experiment2data[4,7]
Vmeask32<-experiment2data[5,7]
Vmeask48<-experiment2data[6,7]
Vmeask100<-experiment2data[7,7]

Vmeas<-c(Vmeask1, Vmeask10, Vmeask20, Vmeask32, Vmeask48, Vmeask100)

#need to redo the error later (2/5)</pre>
```

```
VmeasError<-sqrt((sum(experiment2data[2:7,9])^2))

V<- sqrt(-Vsys^2+Vmeas^2)
Verror<- sqrt(VmeasError^2+ VsysError^2)</pre>
```

#### Calculating G

```
capacitance <-87.875*(10^-12)
capacitanceError <-.594*(10^-12)</pre>
#df is just the x componenent
riemanSum <- function(fa,fb){</pre>
  area <-0.5*(125)*(fb-fa)+fa*125
  return(area)
#resistors<-read.csv("experiment2data1.csv")</pre>
C = capacitance
integrand <- data.frame(</pre>
  gain[2]/(1+(2*pi*C*vin1$x*short)^2),
  gain[2]/(1+(2*pi*C*vin1*x*k1)^2),
  gain[2]/(1+(2*pi*C*vin1$x*k10)^2),
  gain[2]/(1+(2*pi*C*vin1*x*k20)^2),
  gain[2]/(1+(2*pi*C*vin1$x*k35)^2),
  gain[2]/(1+(2*pi*C*vin1$x*k48)^2),
  gain[2]/(1+(2*pi*C*vin1$x*k100)^2)
area <- data.frame(
  G1 = 0,
  G2 = 0,
  G3 = 0,
  G4 = 0,
  G5 = 0.
  G6 = 0,
  G7 = 0
for(i in 1:length(integrand))
    for(1 in 1:398)
      if(is.na(integrand[l+1,i]))
      {
        break
      }
      else
        area[i] <- area[i]+ riemanSum(integrand[l,i],integrand[l+1,i])</pre>
      }
    }
}
```

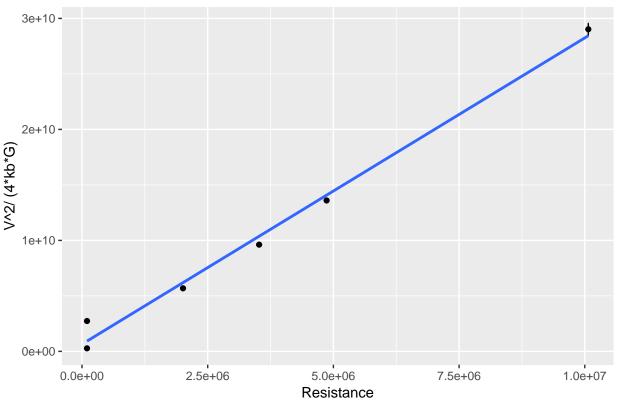

```
area2error=sqrt((capacitance/capacitanceError)^2+(resistors/resistorserror)^2)
```

So this returns a gain value G for each resistor (called "area")

#### Plotting R as a function of V<sup>2</sup>, kB, and G

```
kb<- 1.38064852 *10^-23 #m2 kg s-2 K-1
area2<-area[2:7] #take away the short's data
y_value<- (V^2)/(4*kb*area^2) #area is the vector that contains all G's
#prepare data for graphing
resistors2 <-resistors[1:6]
y<- unlist(y_value, use.names=FALSE)
#I'll try finding temperatures
Temperature <- ((V^2)/(4*kb*area2*resistors2))/1000
Temperature2<-unlist(Temperature, use.names = FALSE)</pre>
print(Temperature2) #these are the correct values
## [1] 273.7115 2739.1314 282.8623 272.9220 279.5173 288.2244
mean(Temperature2)
## [1] 689.3948
#Error Propagation
#resistor as the x axis and the other term as the y axis.
resistors3<-resistors2[1:6]*100
resistors3error <- resistors3*sqrt((V^2/Verror^2)+((area2/area2error)^2))
fit <-lm(y~0+resistors3)
library(ggplot2)
qplot(unlist(resistors3),unlist(y))+geom_errorbar(aes(x=unlist(resistors3), ymin=unlist(y-resistors3err
  geom_smooth(method="lm", se=FALSE, fullrange=TRUE, level=0.95)+labs(title = "Resistance as a function
```
